The Focal Point

A fiscal-driven monetary zugzwang

29 January 2024

Summary

- The potential change in US liquidity conditions may be more dictated by the US Treasury Department than the Federal Reserve in the upcoming days, as the Treasury is set to announce its financing needs and funding strategies.
- The Treasury is expected to re-balance its coupon issuance relative to T-bills in the upcoming QRA, as higher dependency on T-bills to finance its deficits would only postpone the deterioration in the US fiscal condition to the next couple of quarters.
- The Fed may need to react and accommodate continued fiscal expansion in the US while adhering to the limited room where the central bank could ease its policy.
- The Indonesian economy has enjoyed a string of good news for most of January 2024. Alas, events that transpired throughout the last week mark a break from that positive trend. First, despite the aggressive IDR 611.4 Tn (USD 39.43 Bn) of fiscal spending in December 2023, Indonesia's liquidity growth (M2) was recorded at 3.48% YoY, only marginally higher than the post-2008 low of 3.33% YoY in November 2023. Indonesia's FDI inflow growth in Q4 2023 also decelerates to around 5.2% YoY, in contrast, with the double-digit growth recorded since 2022.

Fiscal sets the tune

• Many in the markets have based their expectation of liquidity conditions on signals coming out of the Eccles building (which is the Fed's headquarters). In the upcoming days, however, it might be better to focus our senses on signals coming out of the Treasury building. Meanwhile, the situation in the domestic financial market also did not show the same level of alacrity as shown in the preceding weeks. For instance, foreign investors in the stock market recorded USD 14.05 Mn in net sales between 22-26 January 2024, the first occurrence in 2024. Foreign purchases in the SBN market also remain limited, as indicated by the USD 15.17 Mn in foreign net buys last week. The 2.75% YTD decline in the Rupiah's value provides further indication that the domestic financial market is hurting from the dent in the FFR cuts expectation, which lowers investors' demand for risky assets such as Rupiah-denominated ones.

Indeed, the US Treasury Department is about to conduct its first quarterly refunding announcement (QRA) of the year, outlining the extent of the US government's financing needs and how the US Treasury Department looks to finance its deficit.

- Ever since the debt ceiling agreement, the US Treasury has relied on shorter-tailed Treasury bills (bills) to finance the US government's growing deficits (see Chart 1), which is itself driven in part by growing interest payment. This strategy works for two reasons: first, bills' "money-like" features would draw money market funds (MMFs) to enter the US treasury (UST) market, allowing the Treasury to tap into the ample liquidity in the Fed's repo facility (RRP) to refill its liquidity coffers. Second, since yields on bills present a risk-free rate, T-bills customers tend not to sell riskier securities to add more bills to their portfolios, thus keeping the liquidity condition in the market stable despite the Fed's ongoing quantitative tightening (QT) campaign.
- However, despite the Treasury's hitherto

"Despite its earlier success,

continued reliance on bills

may only postpone the

reckoning day for the US

fiscal situation"

success in refilling the treasury general account (TGA) by issuing more bills, the large size of the issuance - more so than its maturity structure - poses a risk of acute indigestion by the market. The USD 984 Bn of

debt that the Treasury is expected to issue in Q1 2024 represents the third consecutive quarter of mega-issuance, following the USD 1.007 Tn in Q3 2023 and USD 921 Bn in Q4. In particular, the QRA for Q3 on July 31st turned out to be a catalyst for a global bear market in subsequent months, although this was reversed somewhat by the slightly smaller (but still bills-heavy) QRA on November 1st.

Other than the size, the maturity structure of the debt poses another problem for the market and the Fed. The strategy to raise debt by issuing more bills than coupons (treasury notes and bonds) may have worked well in the previous quarter, but such a strategy may only postpone the reckoning day for the US fiscal condition for another quarter rather than eliminate it altogether. Continuing to cut duration may strengthen the headwinds blowing against the US fiscal condition in the short term, as the Treasury would need to issue even higher amounts of bills in subsequent QRAs to refinance bills maturing in the preceding months.

The Treasury's strategy of adding more debt using bills could also add to the Fed's problem. A higher supply of bills may continue to drain the Fed's RRP facility, which has dwindled by around 63.39% from its peak (see Chart 2). The RRP facility acts as a buffer for the Fed in its guest to bring US banks' reserves to their lowest comfortable level (LCLoR). Continued drawdown of the Fed's RRP facility amidst the higher supply of bills would thus remove the safety instrument for the Fed to carry on with its

quantitative tightening (QT)

- campaign, a condition which brings us to the memory of the September 2019 repo crisis when the liquidity condition in the banking sector drops to insufficient level and causing a stress in the interbank market.
- Another option, then, is for the Treasury to start issuing more coupons. Considering that the UST market duration has continued to decline since the debt ceiling agreement, some segments of the market have begun positioning themselves for higher supplies of coupons (see Chart 3), as the Treasury would eventually need to keep the balance between bills and coupon supplies in the UST market. Given that term premiums in the UST market have been increasing before the QRA, the Treasury may concentrate its coupon issuance between 2Y and 10Y notes, rather than longer-tailed bonds.
- Alas, concentrating issuance on the "belly" of the UST market may not eliminate the risk of tightening liquidity conditions. Unlike duration

risk-free bills, term premiums imbued in longerdated coupons would force coupon customers to reassess their risk profile, potentially leading to them selling other risky assets to absorb the newly issued coupons to balance the risk in their book. The expiring bank terms funding programme (BTFP) may also discourage banks from absorbing more coupons, potentially leading to an increase in yields on the longertailed segment of the UST market (see Chart 4).

- Higher coupon issuance, then, may translate to a bear steepening condition (when long-term interest rates rise higher than short-term interest rates) – potentially normalising the UST yield curve out of the hitherto inversion. Both a normalising yield curve and a bear steepening event are often marked as a harbinger of the upcoming economic slowdown, given that higher long-term interest rates are detrimental to the demand for bank loans, and, thus, the US growth potential as credit creation dwindles.
- Whichever instruments the Treasury would issue to finance its debt would hence trap the Fed in a zugzwang; the central bank would need to move as higher T-bills issuance would make the QT campaign more risk-prone, while higher coupon issuance would push the US economy closer towards the maw of a recession. Both strategies, then, should compel the Fed to loosen its policy stance – leading to concerns that the formulation of monetary policies in the US is teetering towards fiscal dominance.
- The Fed, however, is also limited in its ability to loosen its monetary policy posture. Some FOMC officials still worry about the danger of lowering

the policy rate too soon, lest there could be a repeat of the inflationary period of 1966-1983. Fortunately, the central bank might still be able to accommodate higher coupon issuance without making a U-turn on its rate signal. Halting the QT campaign, which so far has managed to reduce the Fed's treasuries holding by an average of USD 51.48 Bn per month, springs as an option. This would help banks digest a higher supply of coupons while preventing reserve levels from thinning out to a dangerously low level. Even a slowdown (or should we say "taper") on the pace of the QT campaign would help soften the blow from further Treasury issuance in the upcoming months.

expectation regarding the timing and the extent of the upcoming Fed funds rate loosening campaign. The Fed still have some cards up its sleeve to keep the liquidity condition in the US stable, while a substantial increase in (long-duration) Treasury yields may spark an inflow to the UST market that threatens other financial markets. Hence, we see no change in our BI rate expectations, especially amidst the risk of narrowing rate differentials between the UST and SBN markets and the mounting uncertainties that now colour Indonesia's financial market.

"Whether bills or coupons, the Fed may need to react to the Treasury's continued fiscal expansions"

Additional durations

The US treasury department issued more long-term bonds in December 2023 as concerns over unbalanced T-bills supplies starts to emerge

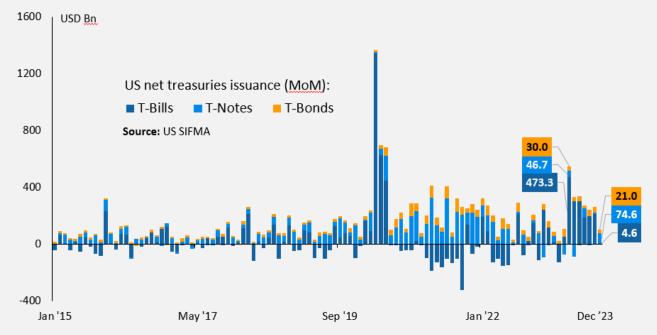

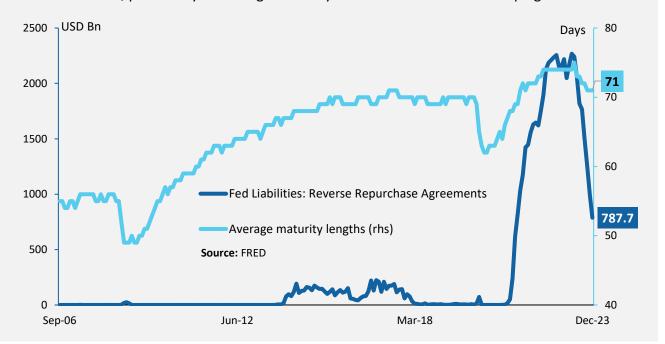

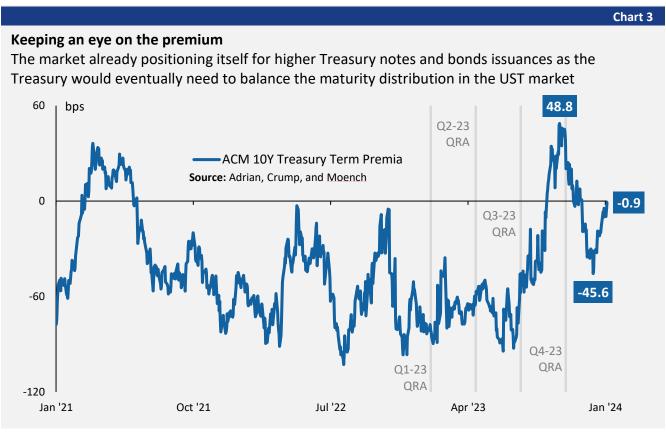

Chart 2

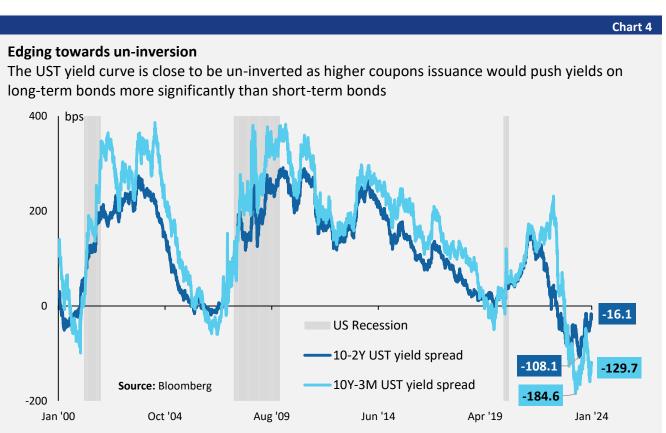

Chart 1

Carrying on without a safety buffer

The outstanding on the Fed's RRP facility dwindles amidst the significant build-up of T-bills supplies in the UST market, potentially removing the safety buffer for the Fed's QT campaign
